

- The disposable plastic cartridges or adapters must be discarded into the garbage immediately after use.

Aftercare Tips:

- Ask about the follow-up care needed with your type of piercing. Your piercer should provide you with verbal and written instructions on how to clean and care for your piercing to help prevent an infection.
- Always wash your hands before cleaning your piercing or the surrounding area.
- Avoid touching your piercing, except to clean, it until it has healed. Piercings may take from several weeks to months to completely heal and may be at a greater risk of infection if irritated by clothing or if the site is not kept clean and dry during the healing period. If your piercing becomes infected it can result in permanent scarring or disfigurement.

See your doctor immediately...

If the pierced area becomes infected (i.e. increased redness, swelling, tenderness and/or the appearance of pus). Removal of jewellery is generally not recommended because the hole can close up around the infected tissue. This can reduce access to the site, preventing necessary care.

Play it Safe! Don't get pierced if...

- A piercer can't or won't answer all of your questions.
- A piercer does not use pre-packaged, sterile, single-use disposable needles.
- A piercer does not use proper cleaning and sterilizing methods in their studio.
- The piercer appears to be under the influence of drugs or alcohol. Alcohol and drugs may impair their judgement and coordination and you'll pay the price for any mistakes they make!
- You have taken drugs or alcohol. Alcohol or drugs may thin your blood and this may lead to excessive bleeding.
